

# Q-Pulse®

## Performing Asset Check

When performing asset checks, it is essential that staff have immediate access to all information supporting the activity that they are about to perform. Without these details, checks may be performed incorrectly, resulting in potentially damaging assets being used in your product or service provision.

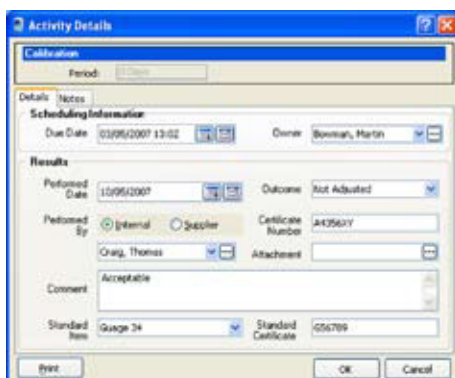

When designing the ability to perform asset checks in Q-Pulse, it was our objective to:

- ensure that staff have all information relating to an asset check available from a single central location
- easily capture and escalate any problems identified when performing a check
- ensure that all the different check activities that can be performed against an asset are catered for
- allow identified issues against an asset to be tracked through to conclusion via the most appropriate workflow
- ensure that all asset check tasks requiring completion are visible, accessible and are performed in a timely, structured manner

Q-Pulse achieves this by:

- providing you with a single central asset register where details on the checks to be performed are just a click away
- ensuring problems spotted against an asset are easily raised via customised incident recording wizards
- enabling unlimited number of checks to be performed against assets including planned maintenance and risk assessments
- assigning problems raised against an asset an appropriate workflow and tracking them through to conclusion accordingly
- easily identifying actions to be performed against an asset via personal action areas

The Q-Pulse solution meets each of the above objectives and in addition:

- ensures the real-time communication of all agreed compliance actions throughout the organisation
- provides watertight security – restricting or providing access to the analysis information appropriate to each individual user
- is easily deployed – one window providing point of reference across the complete compliance management system.
- is easy to use – one click away from accessing your compliance management tasks
